26-27学期-人工智能与计算科学（全英文）1班

GitHub Repository and Markdown Content V1.0 (30XP)

Opened: 星期一, 7 九月 2026, 12:26 AM
Due: 星期六, 24 十月 2026, 11:55 PM

1. General Instructions

Establish your team's GitHub repository and develop the first substantial version of your module's learning content in Markdown.

Markdown is the shared content foundation for your Study Guide, PPT Slides, and Video Tutorials. Use this stage to investigate the subject, organize the learning sequence, and develop accurate explanations, examples, and activities before full production.

V1.0 must contain substantive learning content, not merely headings, copied notes, or a plan for future writing. It does not need to be the finished module, but it must provide enough developed material for the teacher to assess your understanding, coverage, and teaching approach.

Use GitHub throughout the work to coordinate contributions and preserve development history.

Your submission must be self-contained. Submit the actual content and readable evidence of repository development. The teacher may assess the assignment without opening your GitHub link.

Read the attached **Shared Assignment Rules**, particularly the requirements for AI-use records, source attribution, individual contributions, and complete submissions.

2. Specific Requirements

Assignment type: Team assignment — one submission per team
Deadline: October 24, 2026, at 23:59 (Beijing time)

A. Establish and Organize the Repository

Create one shared GitHub repository for the team project. Ensure that all members can contribute and that the teacher can access it if needed.

Include:

· A **README** identifying the team, selected module, members, and their GitHub usernames.

· A clear explanation of the project's purpose and intended learners.

· An overview of the folder structure and where to find the content.

· The shared Markdown content and supporting assets, such as images, diagrams, and example files.

· The current project plan and task list, or a clearly identified location for them.

· A brief statement of the project's current progress and remaining work.

Use meaningful file and folder names. Keep images and other supporting assets organized, and use relative paths where appropriate so that the submitted copy works outside GitHub.

Do not place personal logs or private information in a publicly accessible repository.

B. Develop the Module Structure

Provide an outline covering the whole selected module, including:

· Intended learning outcomes: what beginners should be able to explain or do.

· Major topics and subtopics in a logical learning sequence.

· Any prerequisite knowledge learners will need.

· Planned examples, demonstrations, questions, or activities.

· The current development status of each section.

Use clear status labels, such as **outline only**, **drafted**, **checked**, or **needs revision**. Identify important gaps and uncertainties honestly.

The outline should show how the content forms a coherent learning resource rather than a collection of unrelated facts.

C. Write Substantive Markdown Content V1.0

Begin developing the actual learning material across the module. Fully develop **at least one coherent topic or connected group of subtopics** sufficiently to demonstrate your intended teaching approach.

The developed material must include:

· **Explanations:** Accurate, beginner-friendly explanations of the main concepts.

· **Terminology:** Definitions of unfamiliar terms when they first appear.

· **A worked example or demonstration:** A step-by-step illustration showing how an idea works.

· **A meaningful visual where useful:** A diagram, table, annotated image, or other visual that helps explain the content.

· **A learner activity or application question:** Something that requires learners to use the idea.

· **An answer or expected outcome:** An explanation that allows the learner and teacher to check understanding.

· **References:** Identifiable sources supporting the content and any borrowed material.

One developed topic is a minimum demonstration of quality, not a substitute for meaningful progress on the rest of the module. The submission should show both the overall structure and substantive work beyond an empty outline.

Use headings, lists, tables, images, and code blocks appropriately. Prioritize clear content and organization over decorative formatting.

Do not simply paste textbook passages, previous students' work, or AI output into Markdown. Check the material, organize it for your learners, and be prepared to explain it.

D. Check the Content and Plan Its Use

Have another team member review the developed material.

Check:

· Whether definitions, claims, examples, and answers are correct.

· Whether beginners can follow the explanation without unexplained prerequisites.

· Whether activities can be completed using the information provided.

· Whether sources exist and support the relevant claims.

· Whether images, file references, and supporting assets work in the submitted copy.

Record at least one concrete review outcome: what was checked, what was found, and what was corrected or confirmed. You do not need to invent a problem if the reviewed content is correct.

Briefly explain how the developed content could become:

· A section of the **Study Guide**.

· A visual explanation in the **PPT Slides**.

· A focused explanation or demonstration in a **Video Tutorial**.

You are not required to produce all three finished resources for this assignment.

E. Provide Evidence of GitHub Use and Contributions

Include a clearly labelled **Repository Evidence** section in your submission report.

Evidence	What it should show
Repository overview	Repository name, README, and main files or folders.
Development history	Readable commit history showing authors, dates, and meaningful descriptions of changes.
Examples of actual changes	Selected change views showing what was added, corrected, or improved—not just a list of commit messages.
Individual contributions	Each member's work, the relevant files or sections, and evidence supporting the claimed contribution.
Review and coordination	A representative example of content review, task coordination, or resolving a problem. This may come from GitHub or your documented team discussions.

Use readable screenshots and selected text excerpts, with brief captions explaining what each item demonstrates. Several screenshots may be needed; do not shrink an entire screen until the text becomes unreadable.

Every member must make a substantive contribution. Where practical, members should commit their own changes using identifiable accounts. If one member uploads work on behalf of another, identify both the author and uploader and provide supporting evidence.

A repository link, a screenshot of the repository homepage, or commit counts alone are insufficient evidence of development or contribution. Do not create artificial commits merely to increase activity counts.

F. Submit a Self-Contained Package

Submit one ZIP package named:

TeamName_Stage1_GitHub_Markdown_V1.zip

Include the following:

Item	Required contents
Submission Report — Word or PDF	Team and module information; repository URL; snapshot date and latest commit identifier; content status summary; repository evidence; member contributions; review outcome; and next steps.

Markdown source snapshot	The README, all current content .md files, and supporting assets in their working folder structure.
Readable content copy — PDF	A rendered copy of the current Markdown learning content, including the module outline and development status. Images, tables, examples, questions, and answers must be readable.

The source snapshot should correspond to the repository version identified in the report. A repository download is acceptable if it contains the required files and assets; the hidden .git folder is not required.

All content and evidence required for assessment must be inside the submitted package. GitHub and other links may provide supplementary access, but they must not replace submitted content. Required material available only through a link will be treated as missing.

Include relevant AI-use records in the project and personal logs according to Section 6 of the Shared Assignment Rules. In this assignment's report, briefly identify significant AI assistance affecting the submitted work and indicate the relevant log entries. The actual interaction and verification evidence must be included in the submitted logs, not available only through conversation links.

Before submitting, extract the ZIP into a different folder and check that the files open, the folder structure is clear, and required images and assets are present.

Keep using and updating the repository after this deadline. This submission is the **Stage 1 snapshot**, not the end of repository development.

3. Quality Checklist

Before submitting, check that:

· ☐ The README identifies the team, module, project purpose, and locations of the materials.

· ☐ The module outline covers the intended scope and follows a logical learning sequence.

· ☐ Development status is clearly labelled, with gaps and uncertainties acknowledged.

· ☐ V1.0 contains substantive explanations and at least one coherent, well-developed topic—not only headings or plans.

· ☐ The developed material includes a worked example, an application activity or question, and an explained answer or expected outcome.

· ☐ Important claims and sources have been checked, and borrowed material is acknowledged.

· ☐ Another member has reviewed the content, and a concrete review outcome is documented.

· ☐ Repository evidence shows actual development and supports each member's claimed contribution.

· ☐ The package includes Markdown sources, supporting assets, a readable PDF, and the submission report; it can be assessed without opening external links.

· ☐ Significant AI use is documented in the relevant logs, and members can explain the content and their own decisions.

Submission status

Submission status	No attempt
Grading status	Not graded
Time remaining	Assignment is overdue by: 17 hours 49 mins
